

Creating Server URL :

Required hardware: browser, File Zilla for client

Open www.godaddy.com , after enter user id and password as follows

User id:4983401

Password: Kamish1214

After login go to tab visit my account webhosting mydata. Launch database add

Fill all the details as user name, password etc then click on ok it will create one database(Liquordatabase01)

After that goto Filezilla and connect to mydata.ws as

Click on fileàsite managerànew siteàfill the details what we require

Host: mydata.ws

Protocol: FTP

Encryption: use plain FTP

Log on type: normal

User: posdevelopment

Password: Dallas@123-->connect

Server will be connected .. we got list, in that select aoneposwsàafter that select sarvanabavan or aoneposoriginal (download all the files)

Create new folder(eg:AoneposLiquor) under aoneposws , select that new folder upload all the as we downloaded before..

Open login-details.php(it is in db folder) edit all the details regarding early created database(eg: Liquordatabase01) ie user name,pwd,host,url...

Then after save file and exit it will ask update click on ok now the web server is ready it will given to client (eg url:http://www.mydata.ws/aoneposws/AoneposLiquor/)

After that this url is added to tablet as

Goto setting tab url write the early created url save

Log on to app goto settings- import files—>select the file which data we have to enter in server(make sure that this excel format will be in “.xls” format , no blank lines that means null data)
